| NOTE 1 - ITU-T G. 652 fibres deployed at a radius of 15 mm generally can have macrobending losses of several dB per 10 turns at 1625 nm . <br> NOTE 2 - The macrobending loss can be evaluated using a mandrel winding method (method A of [IEC 60793-1-47]), substituting the bending radius and the number of turns specified in this table. <br> NOTE 3 - This wavelength region can be extended to 1260 nm by adding $0.07 \mathrm{~dB} / \mathrm{km}$ induced Rayleigh scattering loss to the attenuation value at 1310 nm . In this case, the cable cut-off wavelength should not exceed 1250 nm . <br> NOTE 4 - The sampled attenuation average at this wavelength shall be less than or equal to the maximum value specified for the range, 1310 nm to 1625 nm , after hydrogen ageing according to <br> [b-IEC 60793-2-50] regarding the B1.3 fibre category. |  |  |  |  |  |  |
